British Patent No. GB2,377,425, issued on January 15, 2003 to Penn, the present inventor, teaches a metering device that has a chamber with a shuttle therein, and a valve adapted to control the flow of fluid to an end of the chamber, causing the shuttle to move axially and displace fluid from the opposite end. Fluid is then subsequently supplied to the other side of shuttle causing it to move back to its initial position thus dispensing liquid from the other side.

PCT Publication No. WO/00/75,611, issued on December 14, 2000 to the present inventor, describes a metering device that contains a rotor which defines an elongate chamber, the being a shuttle contained within the chamber movable between two terminal end positions. Frusto conical surfaces defined on the rotor cooperate with annular members defining corresponding seats. One passage extends from one end of the chamber to one frusto conical surface, and another passage extends from the other end of the chamber to the other frusto conical surface. Each annual element defines a respective inlet and outlet for fluid and a shuttle is present within the chamber. As the rotor rotates, the shuttle effects a shuttling movement thus measuring dispensed volumes of liquid.

PCT Publication No. WO/90/10,190, issued on September 7, 1990 to Gordeeva et al., describes a device for measuring the parameters of developing surface cracks, that comprises a sensitive element applied to a dielectric sublayer at the point of expected development of a surface crack and comprised of a number of conductors, and further comprises a measuring circuit electrically connected to the sensitive element in which the ends of the conductors are electrically interconnected in series by their main bridges, the sensitive element being also provided with additional bridges each of which is located opposite a main bridge.
